

Floating body

The Wiefferink cable and pipe floating system

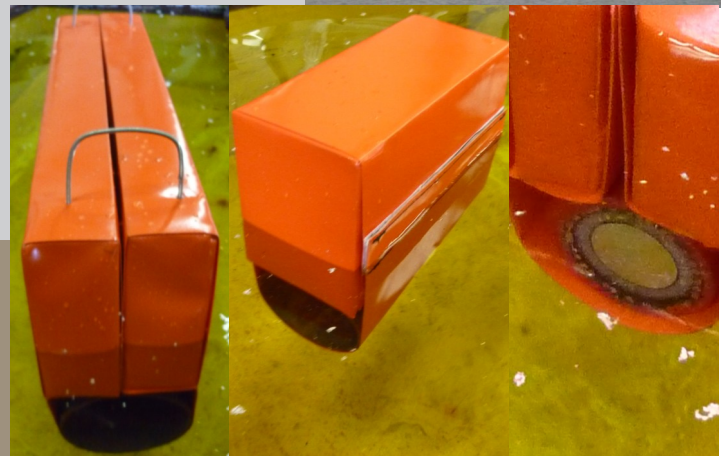

The Wiefferink family of floating bodies is designed based on over 50 years of experience in foil production and water resistant solutions.

In water based construction projects it is often required to have a pipe or cable floating on water. This can be for a period of just a few days or even up to months or years.

Limitations in conventional systems made us design the patented Wiefferink floating body system which is easy to assemble and disassemble and has gravity stabilized optimum floating capabilities.

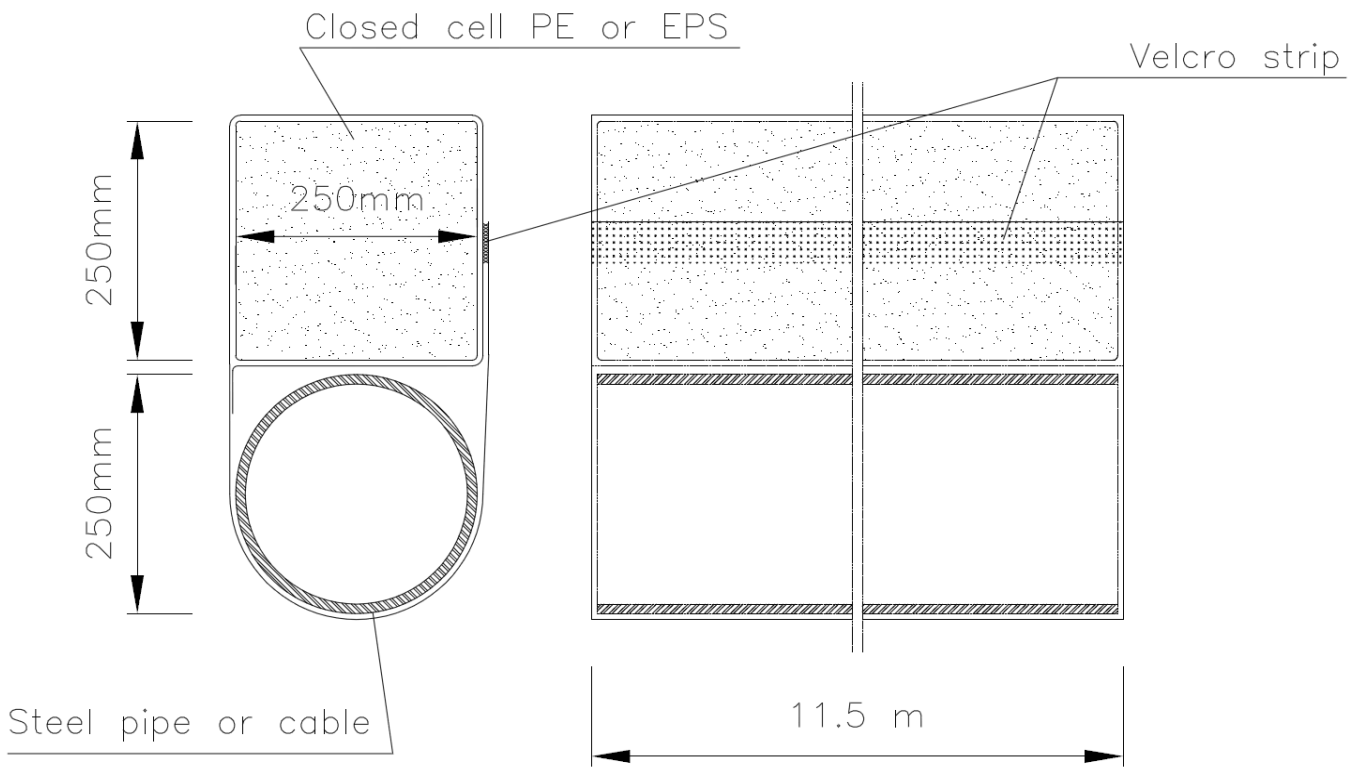

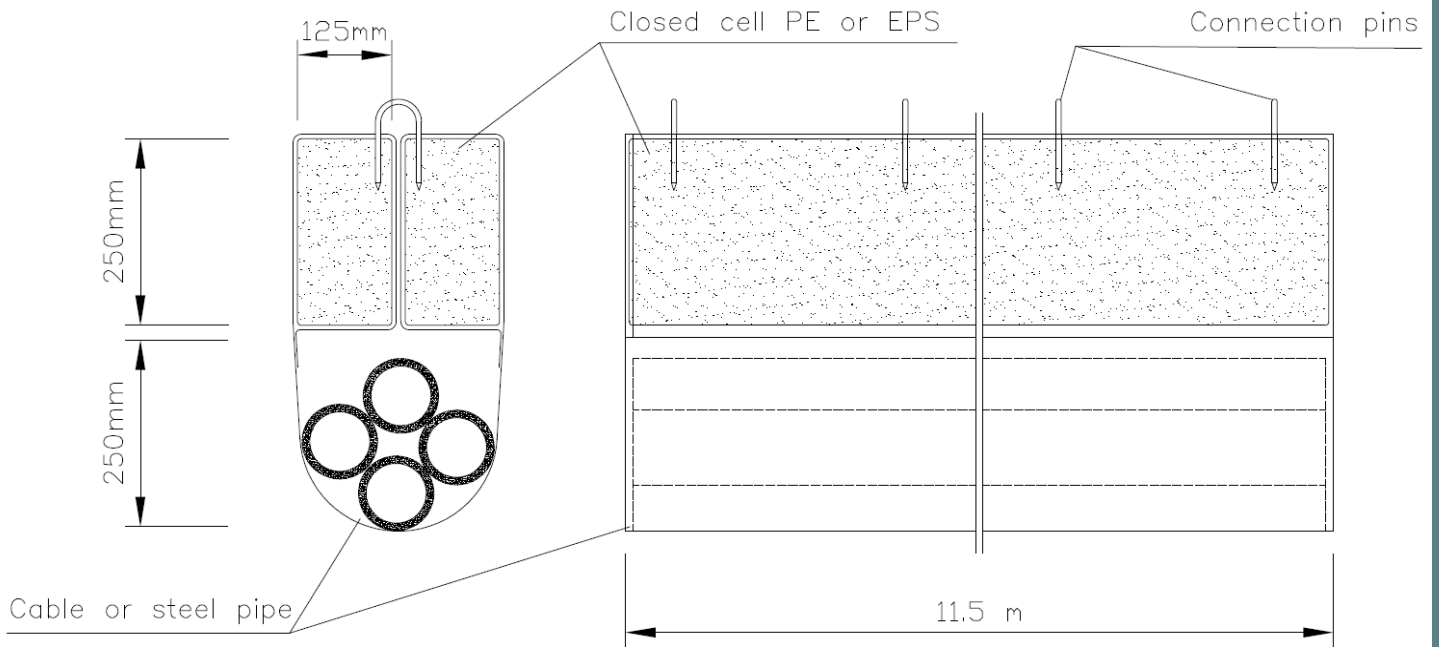

Pipes and power cables from 2" up to 40" with high weights can be floated in still or medium waters. In case of small cables multiple cables can be held in one floating system.

The body will be designed based on customer requirements e.g. size and weight and can be produced for single use or multiple use.

ADVANTAGES OF THE WIEFFERINK BUOYANT:

- Self centering buoyant principle
- Gravity stabilized rigid concept
- No expensive zipper or local welding required
- Designed for optimum (std 20ft or 40ft sea container based) storage and transport
- Buoyant bodies are connectable in length direction
- Low cost pricing and re-usable
